1. Problem Description

ABC Bank wants to sell its term deposit product to customers and before launching the product they want to develop a model which help them in understanding whether a particular customer will buy their product or not (based on customer's past interaction with bank or other Financial Institution).

2. Dataset Information

The data is related with direct marketing campaigns of a Portuguese banking institution. The marketing campaigns were based on phone calls. Often, more than one contact to the same client was required, to access if the product (bank term deposit) would be ('yes') or not ('no') subscribed.

3. Type of the Data used for Analysis.

3.1. Bank client data

The data contains details related to the clients' age, job type, marital status, education level, credit history (default or not), housing loan and personal loans.

3.2. Data related to the last contact of the current campaign.

This part of data contains information related to the way of contact (cellular, mobile etc) and information about time duration of contact like how many days have passed since they contact the client and on which month, they have contacted the client and total call duration in seconds.

3.3. Other Attributes

These attributes are related to the campaign and clients' contact since previous campaign. It includes input variables like campaign, pdays (number of days that passed by after the client was last contacted from a previous campaign), previous (number of contacts performed before this campaign and for this client) and poutcome (outcome of the previous marketing campaign).

4. Attribute Information

4.1. Input Variables

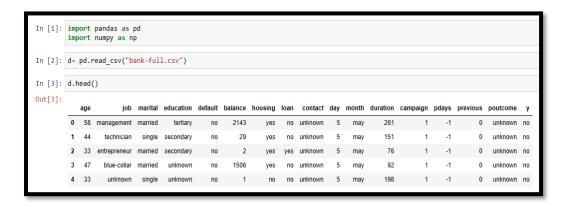

- 1. age (numeric)
- 2. job: type of job (categorical: 'admin.','blue-collar','entrepreneur','housemaid','management','retired','self-employed','services','student','technician','unemployed','unknown')
- 3. marital: marital status (categorical: 'divorced', 'married', 'single', 'unknown'; note: 'divorced' means divorced or widowed)
- 4. education (categorical: 'primary', 'secondary', 'tertiary', 'unknown')
- 5. default: has credit in default? (Categorical: 'no', 'yes')
- 6. balance: average yearly balance, in euros (numerical)
- 7. housing: has housing loan? (Categorical: 'no', 'yes')
- 8. loan: has personal loan? (Categorical: 'no', 'yes')
- 9. contact: contact communication type (categorical: 'cellular', 'telephone', Unknown)
- 10. day: last contact day of the month (numeric)
- 11. month: last contact month of year (categorical: 'jan', 'feb', 'mar', ..., 'nov', 'dec')
- 12. duration: last contact duration, in seconds (numerical)
- 13. campaign: number of contacts performed during this campaign and for this client (numeric, includes last contact)

- 14. pdays: number of days that passed by after the client was last contacted from a previous campaign (numeric; 999 means client was not previously contacted)
- 15. previous: number of contacts performed before this campaign and for this client (numeric)
- 16. poutcome: outcome of the previous marketing campaign (categorical: 'failure', 'unknown', 'success', 'other')

4.2. Output variable (desired target)

17. y - has the client subscribed a term deposit? (Binary: 'yes', 'no')

5. Import Data Set

6. Dataset Details

Shape of the dataset (Number of rows and columns)

```
In [18]: # no of rows and columns d.shape
Out[18]: (45211, 17)
```

Number of rows = 45211 Number of columns = 17

Datatype of Columns and Non-null values

```
In [19]: # Datatypes of columns and non-null values
           d.info()
           <class 'pandas.core.frame.DataFrame'>
RangeIndex: 45211 entries, 0 to 45210
           Data columns (total 17 columns):

# Column Non-Null Count Dtype
            # Column
                                 45211 non-null int64
                  job
marital
                                45211 non-null object
45211 non-null object

```

Numerical and categorical Features

7. Problems in the data

7.1. Null values

```
# total null values in the dataset
d.isnull().sum()
age
job
marital
           0
education
            0
default
            0
balance
housing
           0
loan
contact
           0
day
month
duration
campaign
           0
pdays
           0
previous
poutcome
            0
            0
dtype: int64
```

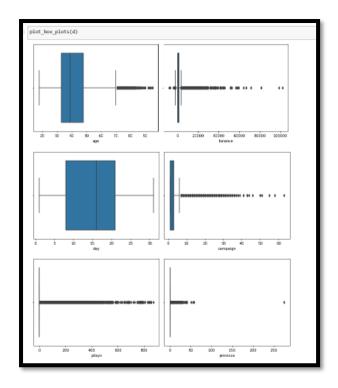

There are no null values in the dataset.

7.2. Outliers and skewness

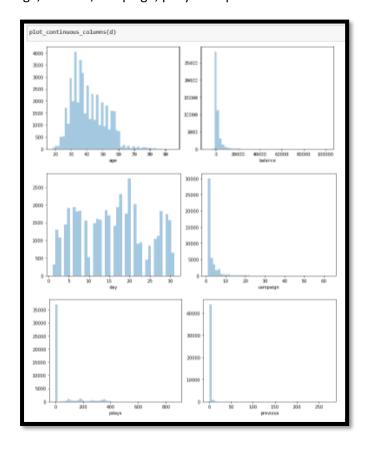

Description of Numerical column

# Description of numerical columns d.describe()													
	age balance		day	duration	campaign	pdays	previous						
count	45211.000000	45211.000000	45211.000000	45211.000000	45211.000000	45211.000000	45211.000000						
mean	40.936210	1362.272058	15.806419	258.163080	2.763841	40.197828	0.580323						
std	10.618762	3044.765829	8.322476	257.527812	3.098021	100.128746	2.303441						
min	18.000000	-8019.000000	1.000000	0.000000	1.000000	-1.000000	0.000000						
25%	33.000000	72.000000	8.000000	103.000000	1.000000	-1.000000	0.000000						
50%	39.000000	448.000000	16.000000	180.000000	2.000000	-1.000000	0.000000						
75%	48.000000	1428.000000	21.000000	319.000000	3.000000	-1.000000	0.000000						
max	95.000000	102127.000000	31.000000	4918.000000	63.000000	871.000000	275.000000						

Numerical variables' visualization

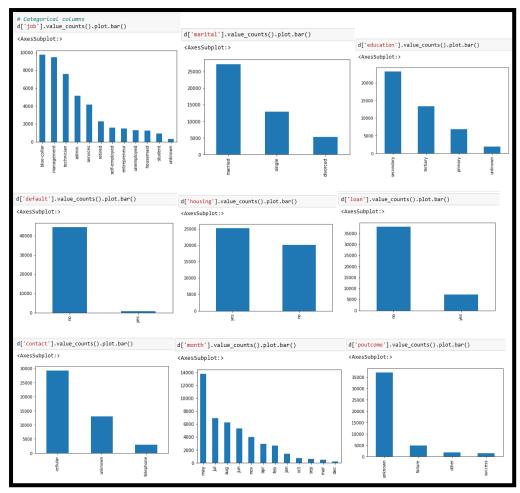

From **description** and **boxplot**, we can see there are outliers in numerical input variables like age, balance, campaign, pdays and previous.

In Histogram, we can see input variables like age, balance, campaign, pdays and previous are **positively skewed**, and we can also see uneven distribution of data in day column.

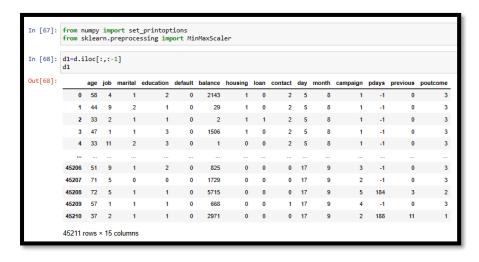

Categorical data visualization

In **Bar chart** of categorical columns, we see uneven distribution of data in almost all the input categorical columns.

8. Feature Scaling -Normalization

To deal with noises in the data, we need to perform feature scaling and as there are both continuous and discrete columns, we are using **normalization scaling technique** to transform features to be on a similar scale. **This improves the performance and training stability of the model**.

```
In [69]: array=d1.values
         scaler=MinMaxScaler(feature_range=(0,1))
         rescaledX=scaler.fit transform(array)
         set_printoptions(precision=2)
         print(rescaledX[0:5,:])
         [[0.52 0.36 0.5 0.67 0.
                                    0.09 1.
                                                        0.13 0.73 0.
                                                                             0.
          [0.34 0.82 1. 0.33 0.
                                    0.07 1.
                                                        0.13 0.73 0.
                                              0.
                                                   1.
                                                                       0.
                                                                            0.
